WORK EXPERIENCE

Senior Software Engineer CoinDCX

06/2022 - Present

Achievements/Tasks

- **Project Norge(New Defi Product)** : Helped in developing a scanner micro-service for listening and processing millions of events on the blockchain using kafka. Further optimised it to use concurrency and various other optimisations in order to reduce the latency of the service by 150%.(stack - golang)
- **Project Mercury(Rewriting monolithic backend)** : Single-handedly developed a micro-service(*exchange-broker*) from scratch responsible for placing orders on Third party exchanges. The server was written in grpc using protobuf as the transmission protocol. For Async communication, used confluent kafka along with protobuf format for messages. (stack : golang)
- **Project Mercury** : Worked on stabilising and maintaining market-data services essentially writing scalable & efficient code to deal with the sheer volume of data. E2E tested multiple microservices, worked closely with devops to build the CI/CD pipelines, highlighted various infra related asks and deployed the services to staging/performance infra. (stack - golang, node-ts)
- **Project Mercury** : Did load testing of the new infra and made various optimisations to make services more resilient enabling them to handle 5X of current production load. Deployed the new infrastructure to production and observed various improvement over the monolithic counter parts : Latency was improved by 50%, Overall stability was improved by a factor of 8X. This resulted in driving revenue upwards by 30% quarterly.(stack - golang, node-ts)

Software Engineer Goibibo (GO-MMT group)

07/2019 - 06/2022

Gurugram, India

Achievements/Tasks

- Worked with CORE mobile team to develop a RESTful backend engine from scratch to power all home screen cards based on segmentation of users which provide order and data of all cards to frontend directly in a streaming api thus resulting in 38% faster loading of home screen (from > 800ms to < 500ms) and easy realtime customization of cards. (stack - golang)
- Created a config based cross sell engine to give more power to product team to easily cross sell other lob on the transacted lob on home screen and booking page thus increasing LOB shoppers by 11%.(stack - JAVA, springboot)
- Created a Unit testing mechanism for the above mentioned project with a mocking mechanism and worked closely with the developer operations team to accommodate the same in the deployment pipeline.(stack - golang)

SKILLS

GOLANG

JAVA

MICROSERVICES

KAFKA

PROTOBUF

SQL

REDIS

GRPC

MONGO

GIT

SUMOLOGIC

DOCKER

BASIC DEVELOPMENT TOOLS

PERSONAL PROJECTS

Ratelt: A Recommender system (Personal college project)

- A simple Recommender system that predicts the ratings of the movies that a user haven't watched yet, by knowing the ratings given by him to other movies.
- The architecture of the deep learning model is based on Stacked Auto-Encoders(SAE).
- The model is built using Pytorch.
- Code available on : <https://github.com/Pr1yanshu/Ratelt>

Lines App (Academic Project, Guide: Prof. Savita Yadav)

- An Android app to teach standing, sleeping, slanting lines and Alphabets to kids.
- Uses Optical Character Recognition(OCR) for detecting letters(Tesseract).
- Available on Google Play Store.

EDUCATION

B.E. in Computer Science & Engineering
Netaji Subhas Institute of Technology(NSIT)

07/2015 - 06/2019

GPA : 7.2

ACHIEVEMENTS

2 times GoTripper of the month award in GO-MMT (Best performers of the month)

Ace performer of the quarter award in GO-MMT(Best performers of the quarter)

Super Satoshi award in CoinDCX(Best performers of the quarter)
